The following guidelines, directives, and DIN standards must be complied with when planning, setting up, and maintaining grid-connected PV systems:

**DIN STANDARDS**

- DIN EN 1991-1 (DIN 1055)
  Actions on structures
- DIN EN 13501 (DIN 4102)
  Fire behavior of building materials and building components
- DIN 18015
  Electrical installations in residential buildings
- DIN 18382
  VOB Construction tendering and contract regulations – Part C: General technical specifications for building works (ATV) – low- and medium voltage systems with nominal voltage up to 36 kV
- DIN 43870
  Meter panels
- DIN EN 60728-11
  Setting up and operating (grounding) aerial systems
- DIN EN 62305 (VDE 0185-305)
  Lightning protection
- DIN EN 62446
  Grid-coupled photovoltaic systems

**DIN VDE PROVISIONS**

- DIN VDE 0100-712
  Erection of low-voltage systems – Part 7-712: Requirements for special installations or locations – solar photovoltaic (PV) power supply systems
- DIN VDE 0100-737
  Erection of low-voltage systems – damp and wet areas and rooms and outdoor systems
- DIN VDE 0105-100
  Operation of electrical systems

**PROPERTY INSURER DIRECTIVES (VDS)**

- VDS 2023
  Guidelines for fire protection in structural systems
- VDS 2024
  Guidelines for fire protection for the installation of electrical equipment in fixtures

**EXCLUSION OF LIABILITY**

The warranty terms available at www.solarwatt.de apply.

**VDE TEST MARK**

You can check the current status of the installation instructions at www.solarwatt.de.
These instructions describe the assembly, connection, maintenance, and disposal of solar modules. Please read them carefully and comply with them accordingly.

The installation and electrical connection of photovoltaic systems may only be carried out by specialist personnel, who are familiar with this work through their professional qualifications. For the installation of the other components, comply with the relevant installation instructions from the manufacturer. The manufacturer is unable to monitor whether these instructions and the conditions and methods for installation, operation, use, and maintenance of the inverter are complied with.

Incorrect installation can cause damage to property, which could consequently pose a risk to people. SOLARWATT accepts no responsibility or liability for losses, damage, or costs resulting from incorrect installation, operation, use, or maintenance or losses, damage, or costs which are connected to any of the above in any way. The SOLARWATT installation instructions should be made available to the operator as part of the solar power system documentation and stored by the operator.

Comply with the guidelines, laws, and regulations valid in the relevant country when planning, setting up, and operating grid-connected PV systems. For information on additional requirements, please contact the responsible local authorities and the network operator.

SOLARWATT solar modules are made from high-quality materials and high-performance solar cells, and are therefore extremely reliable. The quality of the solar modules made exclusively in Germany is ensured by multiple tests carried out on the products throughout the entire production process. SOLARWATT solar modules are VDE-tested and fulfill the requirements of the extended test standard IEC 61215 Ed.2, as well as the safety standard IEC 61730. In SOLARWATT’s own research and development department, tests are carried out using measuring, testing, and environmental simulation equipment which go above and beyond the current valid standards and enable us to optimize our products continually. If treated correctly, your SOLARWATT solar modules will offer you several decades of service.

SOLARWATT recommends insuring the PV system against reduced yields or damage with SOLARWATT Full Coverage for complete security. Further information is available from your SOLARWATT partner or online at www.solarwatt.de.

Information on the solar module

Detailed electrical and mechanical properties for your specific module type can be found on the relevant data sheet. The key technical data under standard test conditions [STC, solar cell temperature: 25°C, irradiation: 1,000 Watt/m², air mass: 1.5 (corresponds to a sun elevation angle of 41.8°)] can also be found on the nameplate of the solar module.

警告

Failure to comply with the installation instructions results in the warranty and guarantee becoming null and void.
TRANSPORT AND STORAGE

SOLARWATT solar modules are made from high-quality materials and are therefore extremely stable and long-lasting. This means that, together with the environmentally-friendly, resource-saving QUICKSTAXX® packaging solution, safe transportation (tested in accordance with ISTA 3E) and easy commissioning are guaranteed. The solar modules should nevertheless be left in the packaging until installation to help prevent any damage. The modules should be stored in a dry place and protected from weather conditions. The packaging (film, tape, pallet, etc.) should be recycled. Contact the responsible local waste disposal company.

The fully biodegradable QUICKSTAXX® packaging edges can be disposed of as household waste or in a suitable compost system. Further information is available in the SOLARWATT product information “Packaging” at www.solarwatt.de.

PROCEDURE IN THE EVENT OF TRANSPORT DAMAGE

You are responsible for checking the goods and packaging for transport damage immediately on receipt. If any damage is discovered, note it on the shipping papers describing each pallet in detail, and take photographs as documentary evidence. Have the driver countersign these notes. If more than ten solar modules on one pallet are damaged, refuse to accept the pallet. Please fill out the “Transport Damage Complaint Notification” form (www.solarwatt.de) and return it to SOLARWATT AG.

INSTALLATION

During installation, please take into account the locally valid construction regulations, accident prevention regulations, the relevant, generally accepted rules of technology and safety regulations for working on roofs and buildings, as well as electrical installations.

SOLARWATT solar modules must be fixed to suitable substruc-
tures, which are designed for the relevant mechanical wind and snow loads, as well as the weight of the solar modules. The instructions from the installation system manufacturer must also be complied with. No mechanical stresses from the actual building (e.g., roof truss) must be transferred to the solar module. Have the structural suitability of the building for the installation of a solar power system checked by a specialist. The frame must not be mechanically or chemically processed.

During installation, avoid creating shades with the module clips or installation system to improve the energy yield. Comply with the minimum distance of 5 mm between the solar modules to allow the material to expand without tension. SOLARWATT BLUE Line solar modules fulfill all the requirements of the extended test standard IEC 61215 Ed.2,
including the increased pressure load of 5,400 Pa, making them ideal for use in areas with large amounts of snow. The local regulations or the standard DIN EN 1991-1 (DIN 1055) should be used for the calculation of the snow loads on the module. It is important to note that these standards are designed for impact on structures and do not explicitly take into account the installation of solar modules.

In regions with particularly high snowfall, the pressure load calculated in accordance with the standard based on local snow load information may be significantly exceeded due to snow overhang or build-up on the solar modules, which could result in above-average stress on the bottom frame edge. SOLARWATT therefore tests its modules above and beyond the standard IEC 61215 Ed.2 and in accordance with additional standards, taking into account additional loads in the event of snow overhang or build-up to reflect the actual loads encountered in practice and to ensure that our products work safely throughout their entire service life. The maximum pressure loads for the fastening methods listed below already take into account these increased requirements and can be regarded as the maximum pressure load in the installation conditions taking into account the shape coefficients in accordance with DIN EN 1991-1 (DIN 1055).

The SOLARWATT BLUE ROOF SOLUTION solar modules can be fastened in a number of ways:

1. **SCREW FIXTURES**
   Fastening on the fastening holes with screws.

   Only use the holes provided in the frame (diameter: 9 mm).

   **Fastening on the fastening holes**
   The maximum pressure load taking into account the shape coefficients in accordance with DIN EN 1991-1 (DIN 1055) for the installation conditions is 2,400 N/m².

---

**WARNING**

The solar modules are not designed for concentrated irradiation. Bundling or concentrating solar irradiation through lenses or mirrors is therefore not permitted and can damage the solar modules.

**NOTE**

The solar module heats up during operation. Ensure that there is sufficient rear ventilation to avoid reductions in yield. Also ensure that no flammable gases can escape or accumulate close by.

**NOTE**

The drainage holes in the module frame must not be covered, as it could cause frost damage on the module frame. Ensure that water cannot run constantly towards the cable screws or plug connectors. Do not place any plug connectors in the frame for this reason.
The bracket must not distort the solar module and the clips must not come into contact with the front pane. Please pay attention to the clip manufacturer’s specifications. The clip surfaces must be sufficiently sized (areas of 500 mm² per fastening point are required).

**Vertical installation**

- **Fastening on short sides**
  - The maximum pressure load taking into account the shape coefficients in accordance with DIN EN 1991-1 (DIN 1055) for the installation conditions is 2,400 N/m².

- **Fastening on long sides**
  - The maximum pressure load taking into account the shape coefficients in accordance with DIN EN 1991-1 (DIN 1055) for the installation conditions is 2,400 N/m².

**Horizontal installation**

- **Fastening on short sides**
  - In addition, this fastening mode requires a central, round or linear support on the lower frame side (central support). The maximum pressure load taking into account the shape coefficients in accordance with DIN EN 1991-1 (DIN 1055) for the installation conditions is 2,400 N/m².

- **Fastening on long sides**
  - The maximum pressure load taking into account the shape coefficients in accordance with DIN EN 1991-1 (DIN 1055) for the installation conditions is 3,500 N/m².

**NOTE**

SOLARWATT solar modules are not regulated construction products in the sense of DIBt (German Institute for Building Technology). It is not permitted to use SOLARWATT solar modules as overhead glazing. For roof installation, the solar modules may only be installed over a fire-resistant roof covering ("hard roof").

**STATUS:** 06/2012 | **INSTALLATION INSTRUCTIONS Rev. 5 | Subject to change | © 2012 SOLARWATT AG
### Vertical Installation

The maximum pressure load taking into account the shape coefficients in accordance with DIN EN 1991-1 (DIN 1055) for the installation conditions is $2,400 \text{ N/m}^2$.

### WARNING

Solar modules generate electrical energy on the front side during incidence of light. A system with multiple solar modules can generate life-threatening voltages and electrical currents. Do not touch the electrical connections or cable ends while the solar module is exposed to light.
ELECTRICAL CONNECTION AND GROUNDING

SOLARWATT solar modules are equipped at the factory with high-quality solar cables and reverse-polarity protected, shock-proof plug connectors. No others may be used. When connecting the modules, ensure that the plugs engage with an audible click.

To ensure that the products are safe and comply with the technical data, only genuine tools from the relevant manufacturer may be used when self-assembling solar cables. The solar cables must be compatible with the module plug system of the relevant manufacturer.

The recommended maximum number of solar modules installed in series is 25. The recommended maximum number of solar modules installed parallel is three (without string fuse). Please comply with the value specified in the data sheet for reverse-current feed and only use standardized photovoltaic cables (recommendation: at least 4 mm² cable cross-section).

The solar modules correspond to application class A and can therefore be operated in systems with dangerous DC voltages (larger than 120 V<sub>dc</sub> in accordance with IEC 61730) and services. Solar modules in this application class can be used in systems with unrestricted access, the relevant regulations must be complied with. SOLARWATT solar modules qualified within this application class in accordance with IEC 61730 fulfill the requirements of protection rating II with correct electrical installation.

! **WARNING**

The plug contacts must not be connected or disconnected under load. Failure to comply with this warning could result in DEATH!

! **NOTE**

It is advisable to install lightening protection in exposed locations. The solar modules should be incorporated in existing lightening protection equipment. For this, take into account the relevant valid regulations (e.g., DIN EN 62305, VDE V 0185-305 and in particular DIN EN 62305-3 Supplement 5 “Lighting and overvoltage protection for photovoltaic power supply systems”). The maximum open circuit voltage for the solar generator must not be higher than the specified maximum system voltage of the solar module.
In installation conditions, a solar module can deliver a higher current and/or higher voltage than under standardized test conditions. Consequently, the short circuit current $I_{SC}$ and open circuit voltage $U_{OC}$ specified on the solar modules should be multiplied by 1.25 to determine the rated voltage values of components, the rated current values of conductors, and the size of fuses and to measure controls connected to the solar modules.

Any type of soiling on the plug contacts before or after installation (dust, moisture, aerosols containing salt, etc.) has a negative influence on the system function over the intended service period. For this reason it is necessary to pay particular attention to cleanliness during installation. The use of lubricants is not permitted. Always protect unplugged connectors against soiling of any type during transport, storage, and during installation, as the connectors only satisfy the requirements for their protection category when plugged in. It is forbidden to open the junction box or modify or remove the cable or frame.

The minimum bend radius for the connection cable is 60 mm. The cables must be laid so that mechanical strain on the conductors and connections is ruled out. Take into account the product-specific length of the connection cable specified in the relevant data sheets at www.solarwatt.de

Potential equalization of the solar generator is prepared in the factory and is recommended. It can be carried out using the existing grounding bores on the long sides of the frame in accordance with the valid local regulations.

**MAINTENANCE AND SERVICING**

A photovoltaic system needs practically no maintenance, as the solar modules are cleaned by the rain at the recommended minimum angle of 15°. To avoid reductions in yield, we do, however, recommend carrying out a regular visual check on the module surfaces. Particularly heavy soiling (e.g., leaves) can cause shades which reduce performance and should therefore be removed. Clean the glass surface with water and a soft sponge only. In exceptional cases, a conventional cleaning agent may also be used in the recommended dose. Do not use aggressive cleaning agents or metal objects, as they can be particularly damaging to the hardened glass surface. The electric cables should (where accessible) be checked regularly for damage, corrosion, and firm hold. Pay particular attention to BGV A3, DIN VDE 0105-100.

**DISPOSAL**

Dispose of defective or old solar modules properly; they should never be disposed of with domestic waste. For this reason, we offer our customers return and recycling of our solar modules. Contact us by e-mail at info@solarwatt.de and specify the number and type of modules to be returned. We will then coordinate all further details for returning your modules.

**NOTES ON COMPLAINTS**

If you still have cause for complaint despite the high quality of our products, please contact your dealer directly or:
